                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligonucleotide which will hybridise under selected conditions to Human Papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: probe duplex. The present sequence represents a specifically claimed target region. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these from other HPV variants. Papillomaviruses are small DNA viruses and HPV Types 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe:target duplex formation; target nucleic acid is optionally amplified. Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper probe may be used. Oligonucleotides can distinguish target sequences from phylogenetically close HPV Types 16 and 18 whilst available detection sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Novel hybridisation assay probes have been developed comprising an oligonuclectide which will hybridise under selected conditions to Human oligonuclectide which will hybridise under selected conditions to Human Papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: probe duplex. The present sequence represents a specifically claimed target region. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these from other HPV variants. Papillomaviruses are small DNA viruses and HPV Types 16 and 18 are associated with genital cancers. HPV PCR primers can amplify HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human Papillomavirus Type 16 target region
                                                                                                                                                                                                                                                                                                                                                                    Gordon P,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human papillomavirus.

                                                          CC Novel hybridisation assay probes have been developed comprising an CC oligonucleotide which will hybridise under selected conditions to Human CC papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, CC 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed CC target region. Oligonucleotides are useful to detect HPV Type 16 and/or CC 18 in samples e.g. cervical smears, body fluid, and distinguish these CC from other HPV variants. Papillomaviruses are small DNA viruses and HPV CC Types 16 and/or 18 are associated with genital cancers. HPV PCR primers can CC amplify HPV Type 16 and/or 18 nucleic acid is optionally amplified. Type 16 or CC cand/or 18 can be detected by adding a probe and detecting probe trarget CC one specifically detected by amplifying nucleic acids with at least CC one specifically claimed PCR primer. For Type 18 detection, a helper CC probe may be used. Oligonucleotides can distinguish target sequences from CC sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper probe may be used. Oligonucleotides can distinguish target sequences from phylogenetically close HPV Types 16 and 18 whilst available detection sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Probes for detection of Human Papillomavirus Type 16 and Type 18 - can distinguish between Type 16 and 18, associated with genital cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human Papillomavirus; probe; target region; genital cancer; HPV; cervical smear; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 21 BP; 5 A; 5 C; 6 G;

                                                                                                                                     CC Papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, 35, or 58) target nucleic acids to form detectable target: CC grobe duplex. The present sequence represents a specifically claimed CC target region. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these CC from other HPV variants. Papillomaviruses are small DNA viruses and HPV CC Types 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16 or CC amplify HPV Type 16 and/or 18 nucleic acid is optionally amplified. Type 16 or CC quplex formation; target nucleic acid is optionally amplified. Type 16 or CC 18 can be specifically detected by amplifying nucleic acids with at least CC one specifically claimed PCR primer. For Type 18 detection, a helper CC probe may be used. Oligonucleotides can distinguish target sequences from CC phylogenetically close HPV Types 16 and 18 whilst available detection CC sera react with antigens of all papillomaviruses

The assay comprises: (1) combining nucleic acid in the sample with at least one detectable probe able to hybridise with 1 or more HPV types; and (2) detecting presence or absence of hybrid complexes. Opt. several probes are used, eg one for HPV types 6 and 11, associated with benign warts, and one for types 16, 18, 31, 33 and 35, associated with cervical cancer. The assay can differentiate between HPV types. It is esp. used as a secondary test. The probes can be synthesised or cloned. (Updated on 27-AUG-2003 to correct OS field.)
                                                                  Detecting target nucleic acid by hybridisation with probe that generates looped-out region - then using second probe, hybridised to this region, to initiate nucleic acid synthesis, for disease diagnosis, detecting
                                                                                                                                                                                                                                                                                                                            Human papillomavirus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC sample by: (a) hybridising the target with a first probe (P1) having 3' CC and 5' portions complementary to adjacent regions of the target, with an CC intervening, non-complementary portion so that the resulting CC hybridisation complex includes a looped-out region in which non-CC contiguous regions of P1 are brought close together; (b) hybridising CC second probe (P2) to these non-contiguous regions; (c) initiating nucleic acid synthesis, dependent on hybridisation of P2 to P1, and (d) detecting CC newly formed nucleic acid. In a modification, the looped-out region is CC contiguous regions of the target rather than P1, and then P2 hybridises to non-CC contiguous regions of the target. The present sequence used in an example from the present invention. The method CC is used for diagnosis of infectious disease or chromosomal abnormalities; CC for detecting Salmonella in foods or Escherichia coli in water. The CC method does not require making copies of the target or long tracts of CC sequence; is applicable to DNA or RNA (including those without discrete code improved specificity) and the hybridisation events to generate a signal (for a salvition).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               X22222222222222222222222222222222
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a cell (I) comprising pre-trans-splicing compocules (PTMs) (II) which have one or more target binding domains (IIa) that target binding of PTM to pre-mRNA, 3' splice region (IIb) that coincides branch point pyrimidine tract and 3' splice acceptor site, or 5' splice site (IIc), spacer region (IId) that separates RNA splice site (IC from target binding domain, and nucleotide sequence to (IIe) be trans-cc spliced to target-pre-mRNA, Optionally, the cell comprises (II) either comprising: (A) (IIb) and (IIe); or (B) (IIc), (IId) and (IIe). The cell comprises (II) comprises or more (preferably two or more) (IIa) and (IIb) (or (IIc)), (IId) and (IIe), or (II) comprising contacting a target pre-mRNA collected in decell (IIb) (or (IIc)), (IId) and (IIe), or (II) comprising either (A) or (B) (IId) which involves contacting a target pre-mRNA expressed in the cell contacting the first produced to target pre-mRNA propressed comprises sequence sencoting a toxin or translatable correct. The nucleotide sequence to be trans-spliced to target pre-mRNA comprises nucleotide sequences comprising exons 1-10 of cystic fibrosis trans-membrane conductance regulator (CPTR). The chimeric RNA produced using (II) which either comprises (A) or (B) further comprises a nucleotide sequence tag. (I) can be used for gene regulation, contacting genetic, infectious or autoimmune diseases and contactine diseases including genetic, infectious or autoimmune diseases and contactine acceptance and to regulate gene expression in the complification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a cell (I) comprising pre-trans-splicing CC molecules (PTMs) (II) which have one or more target binding domains (IIa) that target binding of PTM to pre-mRNA, 3' splice region (IIb) that CC includes branch point pyrimidine tract and 3'splice acceptor site, or 5' splice site (IIc), spacer region (IId) that separates RNA splice site (IC splice site (IIc), spacer region (IId) that separates RNA splice site CC from target binding domain, and nucleotide sequence to (IIe) be trans-CC spliced to target-pre-mRNA. Optionally, the cell comprises (II) either CC comprising: (A) (IIb) and (IIe); or (B) (IIc), (IId) and (IIe). The cell comprising: (A) (IIb) and (IIe); or (B) (IIc), (IId) and can be used in gene CC immunosuppressive and antimicrobial activities, and can be used in gene CC therapy. (II) comprising one or more (preferably two or more) (IIa) and (CC (IIb) (or (IIc)), (IId) and (IIe), or (II) comprising either (A) or (B) (CC (EID) (or (IId)), is useful for producing a chimeric RNA molecule in a CC (EID) (in that is recognised by nuclear splicing components. The chimeric CNA more contacting a target pre-mRNA expressed in the cell contacting to the contacting a component of the cell contacting a component of the cell contacting a component of the cell contacting components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The nucleotide sequence to be trans-spliced to target pre-mRNA preferably comprises nucleotide sequence comprising exons 1-10 of cystic fibrosis trans-membrane conductance regulator (CFTR). The chimeric RNA molecule produced using (II) which either comprises (A) or (B) further comprises a nucleotide sequence tag. (I) can be used for gene regulation, gene repair and targeted cell death. (I) can be used for the treatment of various diseases including genetic, infectious or autoimmune diseases and proliferative disorders such as cancer and to regulate gene expression in plants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel immortalized endometrial glandular epithelial cell strain in which an exogenous immortalizing gene is introduced and the properties of the cell line as non-cancer typical glandular epithelial cells, are maintained. The cell line of the invention may be useful for research of reproduction, particularly for analyzing the adhesion of the fertilized egg during implantation, analyzing the effect of steroid hormones, analyzing the mechanism of multistep canceration of the inner glandular epithelial membrane by genetic engineering of the cell line which is otherwise non-cancerous, and analyzing the effect of carcinogenic substances on the cell line. The cell line maintains the properties of normal somatic cells and the properties of endometrial glandular epithelial cells. The current sequence is that of the Human papillomavirus type 16 E6 delta151 mutant

The method involves introducing a vector containing a nucleotide sequence encoding a chimeric immunogen comprising a protein processing signal and the target protesin or its fragment. The immunogen is produced by the cells and processed so that the target protein or its fragment is presented to the patients immune system and a cellular immune response is initiated. The method and vectors can be used as a form of vaccination and could be used to generate a cellular immune response in patients to, e.g. cancerous tumours. The cellular immune response is the predominant immune response in the patient. This sequence represents a DNA fragment which encodes a tumour antigen from human papillomavirus 86 described in the method of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC thmourigenic human Schwann or schwannoma cell line comprising: providing ca cell culture of human Schwann or schwannoma cells, introducing a collynucleotide comprising an exogenous immortalising gene into the cells, and selecting for immortalised cells that express the exogenous commortalising gene and retain phenotypic properties of Schwann or commortalising gene and retain phenotypic properties of Schwann or commortalising gene into the cells, the invention further comprises: determining the effect of schwannoma cells. The invention further comprises determining the comprises creening cancer chemotherapeutic and antineoplastic activity of an agent producing an immortalised consisting carcinogenicity of an agent; screening the neuroprotective activity of an agent; treating neurodegeneration in a patient; and a kit for screening an immortalised non-tumourigenic human Schwann or schwannoma cell line, the polynucleotide is a subgenemic fragment of a virus consisting of Sy40 (Simian Virus 40), adenovirus and human papilloma consisting of types 18, 31, 33 or 35, but preferably 16. The immortalised consisting of types 18, 31, 33 or 35, but preferably 16. The immortalised con-tumourigenic human Schwann or schwannoma cell line has cytostatic and neuroprotective activity and be useful in treating disorders by gene therapy. The method is useful for producing an immortalised non-tumourigenic human Schwann or schwannoma cell line cativity of an agent, testing carcinogenicity of an agent and screening a neuroprotective activity of carcinogenicity of an agent and screening a neuroprotective activity of an agent, testing carcinogenicity of an agent and screening a neuroprotective activity of carcinogenicity of an agent and screening a neuroprotective activity of carcinogenicity of an agent and screening a neuroprotective activity of carcinogenicity of an agent and screening and cancer. This polymucleotide represents the bunch of the immortalised non-tumourigenic human Schwann or call line of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

marker corresponds to a secreted protein or to a transcribed corresponds to a secreted protein or to a transcribed secreted or its portion. The level of expression of the marker is casessed by detecting the presence in the sample, a protein or protein corresponding to the marker. The presence of protein or protein corresponding to the marker. The presence of protein or protein corresponding to the marker. The presence of a transcribed protein or protein or protein or protein or protein or protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed corpolynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The carrier which involves detecting expression of the marker in a patient which involves detecting expression of the marker in a patient thine and comparing the level of expression. The method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. noncarcous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker to a control marker ovarian cancer. The level of expression of a marker in a control marker ovarian cancer. The level of expression of a marker in a control marker ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            15-JUN-2000; 2000US-0211940P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel purified complex comprising a first polypeptide and a second polypeptide, where the polypeptides comprise defined amino acid sequences listed in the specification, and where the first polypeptide binds to the second polypeptide. A complex of the invention has virucide and cytostatic activity, and may have a use as a vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered level of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09584-ADF09697 represent cDNA's of the
                                                                                                                                                                                                                                                                                                              Virucide; cytostatic; anti-HIV; dermatological; small interfering RNA; selective post-translational silencing; siRNA; oncogene; genital wart; human papilloma virus; HPV gene; cancer; human cervical cancer; HIV; smallpox; flu; common cold; cervical cancer; penile cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New purified complex comprising a first polypeptide and a second polypeptide, useful for identifying agents for treating/preventing a condition involving altered level of the complex e.g. human papilloma virus infection, or cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for selective post-translational CC silencing in a mammalian cell of the expression of an exogenous gene of cviral origin. The method comprises introducing into the cell a small CC interfering RNA (siRNA) construct that is homologous to a part of the CC mRNA sequence of the gene. The method is useful for the selective post-cc transcriptional silencing of an exogenous gene of viral origin (e.g. an CC concepte or human papilloms virus (HPV) gene) in a mammalian cell. The CC method or the siRNA is particularly useful for treating cancer, human cc cervical cancer, human immunodeficiency virus (HIV), smallpox, flu, CC common cold, or a disease caused by a HPV (e.g. genital warte, cervical CC vulgaris). An siRNA construct or vector is useful for use as a medicament CC for the diseases mentioned. The polynucleotide sequence of the invention CC can be used to treat disorders by gene therapy. This polynucleotide correction con control to the control of the invention CC can be used to treat disorders by gene therapy. The method comprises introducing into the cell a small interfering RNA (siRNA) construct that is homologous to a part of the mRNA sequence of the gene. The method is useful for the selective post-transcriptional silencing of an exogenous gene of viral origin (e.g. an oncogene or human papilloma virus (HPV) gene) in a mammalian cell. The method or the siRNA is particularly useful for treating cancer, human cell. The common cold, or a disease caused by a HPV (e.g. genital warts, cervical cancer, penile cancer, malignant squamous cell carcinomas or veruca culgaris). An siRNA construct or vector is useful for use as a medicament for the diseases mentioned. The polynucleotide sequence of the invention can be used to treat disorders by gene therapy. This polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selective post-transcriptional silencing of an exogenous viral gene (e.g. human papilloma virus (HPV) E6), for treating e.g. cancer, comprises using a small interfering RNA (siRNA) construct homologous to an mRNA of
                                             exogenous immortalizing gene and and typical glandular epithelial reproduction.
                                                               Immortalized endometrial glandular epithelial cell strain containing exogenous immortalizing gene and maintains properties of non-cancer and typical glandular epithelial cells, useful in field of research and typical glandular epithelial cells, useful in field of research and typical glandular epithelial cells, useful in field of research and typical glandular epithelial cells, useful in field of research and typical glandular epithelial cells, useful in field of research and typical glandular epithelial cells.

The invention relates to a novel immortalized endometrial glandular epithelial cell strain in which an exogenous immortalizing gene is introduced and the properties of the cell line as non-cancer typical glandular epithelial cells, are maintained. The cell line of the invention may be useful for research of reproduction, particularly for analyzing the adhesion of the fertilized egg during implantation, analyzing the effect of steroid hormones, analyzing the mechanism of multistep canceration of the inner glandular epithelial membrane by genetic engineering of the cell line which is otherwise non-cancerous, and analyzing the effect of carcinogenic substances on the cell line. To cell line maintains the properties of normal somatic cells and the properties of endometrial glandular epithelial cells. The current sequence is that of the Human papillomavirus type 16 E6 wild-type gene the invention.

2005-405310/41.

Composition useful for delivering an agent into a cell comprises the agent, a transfer agent and a solid or colloidal carrier medium.

Disclosure; SEQ ID NO 17; 56pp; English.

The present invention relates to a method and composition comprising a transfer agent and a solid or colloidal carrier medium for delivering biological agents into cells. The invention is useful for the treatment of cancer, tumor, carcinoma of cutaneous, squamous or cervical epithelia and colorectal carcinoma, wounds, burns and scars. The invention is also useful in gene therapy. The present sequence is the human papillomavirus type 16 E6/E7 gene fragment. This sequence is useful in a method for treating carcinomas.

                                                     Matches
                                                                              Query Match
                                                                                                                              A variant of the human papilloma virus (HPV) E6 or E7 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV infection. The variant is preferably a delection mutant comprising at least half, and preferably two terminal, or is a full length E6 or E7 protein starting from the N- or C- terminal, or is a full length E6 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence encodes a fusion between the C-terminal end of E6 and the N-terminal end of E7. The protein is also a deletion mutant generated from the sequence described in AAT31833. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                         Vaccine variants of human papilloma virus antigens - contain variants of E6 and/or E7 protein, pref. deletion mutants, and are used to treat or prevent HPV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             misc_feature

The present sequence represents the human papillomavirus fusion gene encoding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human papillomavirus E6/E7 fusion gene carrier and fusion protein vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences of the E6 and E7 polypeptide-encoding regions of human papillomavirus (HPV) 16 and 18 are given in AAQ75470-71 and the encoded proteins in AAR63865-66, respectively. Probes and primers based on these sequences were used for HPV infection diagnosis; expression of E6 and E7 is diagnostic for cervical cancer or pre-malignant states. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise
              The invention relates to nucleic acid markers which are overexpressed ovarian cancer cells as compared to their expression in normal (i.e. r cancerous) ovarian cells. The invention also relates to polypeptides
                                                                                                                                                                           Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human ovarian cancer DNA marker #17388.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human papilloma virus detection assay - by amplification using self sustained sequence replication and hybridisation with a detector probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1995-006821/01.

The markers are useful for assessing if a patient is afflicted cinvention. The markers are useful for assessing if expression of the comparing the level of expression of the career in a control non-ovarian cancer sample. A difference between the career in a control non-ovarian cancer is level of expression of the marker in a control non-ovarian cancer. The level of expression of a complement of the corresponds to a secreted protein or to a transcribed complement corresponding to the marker. The presence of protein or protein fragment is detected using an antibody that specifically binds with the component of protein or protein of the marker is assessed by detecting the presence of a transcribed complement which anneals with the marker, under stringent conditions. The patient which involves detecting the marker, under stringent conditions. The sample at a first point in time, repeating the marker in a patient condition of the marker in a patient condition of the marker in a patient condition of the sample at a first point in time, repeating the method at a subsequent condition of the marker in a patient condition of the marker in a patient condition of the marker in a patient condition of the marker of the invention.

Cc invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     typing human papilloma virus (HPV) in non-frozen cellular smears fixed to a support in absence of aldehyde-based crosslinking reagents. The assay comprises: (1) combining nucleic acid in the sample with at least one detectable probe able to hybridise with 1 or more HPV types; and (2) detecting presence or absence of hybrid complexes. Opt. several probes are used, eg one for HPV types 6 and 11, associated with benign warts, and one for types 16, 18, 31, 33 and 35, associated with cervical cancer. The assay can differentiate between HPV types. It is esp. used as a secondary test. The probes can be synthesised or cloned. (Updated on 27-AUG-2003 to correct OS field.)
The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a
                                                                                                                                                          Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                Disclosure;

The presence of protein or protein fragment corresponding to the marker. The presence of protein or protein fragment is detected using an antibody that specifically binds with the correction of protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed corplynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient time and comparing the level of expression. The method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, correct using an ovarian tissue sample. A composition comprising a marker. The sequence represents a human ovarian cancer DNA marker of the correct of the printed specification, but was obtained in electronic format directly from wife at fig. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a
New isolated nucleic acid for diagnosing and treating cervical for assessing and detecting compounds for treating the cancer.

문 δ

The present sequence encodes an E7E6 fusion protein, comprising wild type E7 and E6 polypeptides from human papillomavirus type 16 (HFV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in acids corresponding to amino acids 24, 26 or 91 of the sequence given in

no

The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy
                                                                                                                                                                                                                               New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.

The present sequence encodes a fusion protein, comprising E6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E6E7PentM, and comprises an E6 amino terminus (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy terminus (where residues 24, 26 and 91 have been replaced with glycine). E6E7PentM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive
                                                                                                                                                                                                                                                                                                                                                                      New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      03-OCT-2002; 2002US-0415929P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   02-OCT-2003; 2003WO-US031726

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence given in ADO44073 and the 86 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                  New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human papillomavirus Synthetic.

The present sequence encodes an E6E7 fusion protein, comprising wild type E6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of

type

sequence given in ADO44072.

The polypeptides of the

invention are

Example 1; Page 68; 101pp; English.

The present sequence encodes a fusion protein, comprising E6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E6E7TetM, and comprises an E6 amino terminus (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy terminus (where residues 24 and 26 have been replaced with glycine).

86E7TetM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 27 to mutations or has mutations at any one or more of the amino acids corresponding to amino acids 30 or 106 of
                                                                                                                                                                                                                            New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive
                                                                                                                                                                                                Claim 24; Page 70; 101pp; English.

The present sequence encodes a fusion protein, comprising E7 and E6 polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E786TetM, and comprises an E7 amino terminus (where residues 24 and 26 have been replaced with glycine) and an E6 carboxy terminus (where residues 63 and 106 have been replaced with glycine). E786TetM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive
                                                                                                                                                                                                                                                                                                                                                                           New polypeptide comprising human papillomavirus R6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human papillomavirus Synthetic.
                                                                                                                                                                                                                                                                                                                     Claim 24; Page 74-75; 101pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
The present sequence encodes a fusion protein, comprising E7 and E6 polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E7E6PentM, and comprises an E7 amino terminus (where residues 24, 26 and 91 have been replaced with glycine) and a carboxy terminus (where residues 63 and 106 have been replaced with glycine). E7E6PentM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E polypeptides, where the E7 polypeptide has mutations at any one or m of the amino acids corresponding to amino acids 24, 26 or 91 of the
                                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                                                                   03-OCT-2002; 2002US-0415929P

The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                               Virus-like particle vaccines containing dengue virus recombinant as core for carrier, applicable in preventives or/and remedies for the cervical cancer and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ds; gene; cytostatic; virucide; dengue virus; recombinant replicon; deletion; preM protein; C protein; NS1 protein signal; vaccine; cervical cancer; viral disease; antigen; dendritic cell; immune res

```

A dengue virus recombinant replicon has a deletion of the complete coding sequence for preM protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of NS1 protein signal; coding regions of all non-structural proteins. The

Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus cDNA clone (pRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to the HPV type 16 E7 gene used as the gene of interest in the recombinant replicon of the invention.
                                                                                                                                                                                                 WPI; 2006-109169/11.

The DEN replicon contains exogenous nucleotide sequences such as human papillomavirus (HPV) antigen proteins, immune regulators or combination of HPV antigen and immune regulators. The invention is useful for producing a drug for the prophylaxis and treatment of cancer or viral infection. The present sequence is a human papillomavirus oncogene.

The B6/B7 region of human papilloma virus (HPV) 16 is used especially to detect mRNA being transcribed from this region which becomes active in transformed cells. The method can be used for the early diagnosis of cervical cancer. Primers used to amplify fragments of the B6/B7 region are described in AAT14664-T14674. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection of low copy number intracellular markers - by 3SR amplification of target RNA in fixed cells then hybridisation with labelled probe, for detecting human papilloma virus in cervical cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic.

The degree of HPV infection can be assessed, by measuring levels of expression of genes involved in the diseased state, and comparing the expression to each other or to reference genes. (Updated 27-AUG-2003 to correct OS field.)

The DNA prod. has a site for Ncol at the beginning of the E6 gene and a Smal site immediately downstream of the termination codon for E7. The E6 and E7 ORPs are fused together to form a single continuous ORP via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-16 E6/B7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the immune system against HPV. See also AAQ23955-400 and AAQ239450-69. (Updated on 25-MAR-2003) to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                      Vaccine variants of human papilloma virus antigens - contain variants of E6 and/or E7 protein, pref. deletion mutants, and are used to treat or prevent HPV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treating and vaccinating against \ensuremath{\mathsf{HPV}} infections and conditions caused them, such as cervical cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A variant of the human papilloma virus (HPV) E6 or E7 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV infection. The variant is preferably a deletion mutant comprising at least half, and preferably two thirds of full length E6 or E7 protein starting from the N- or C- terminal, or is a full length E6 molety fused to a full length E7 molety. The variant optionally has a linkage molety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence encodes a full length E6/E7 fusion protein. (Updated on 27-AUG-2003 to correct OS
                              AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY2575-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used if preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fusion protein; E6 protein; E7 protein; E6/E7; immunomodulator; tumour; immunological fusion partner; CpG oligonucleotide; immune response; HPV antigen; prevention; treatment; 88.

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. ```

```
The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) R6 and E7 proteins (singly, as an E6-E7 fusion or mutatted) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence encodes an HPV-H. influenzae D protein, fusion protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic. These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the coding region for a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the streptococcus pneumoniae CLYTA protein. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                      The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 879 BP; 289 A; 168 C; 209 G; 213 T; 0 U; 0 Other;

The invention concerns transgenic non-human animals that express oncogenes of interest in their epithelial cells, and materials and methods for their production. Expression of the oncogenes is controlled by a sequence from the human involucrin upstream regulatory region (see AAA09476) which targets expression to desired tissues and cells (i.e. suprabasal scratified squamous epithelial tissue). The transgenic animal are useful as animal models for studying neoplastic diseases that affect epithelial tissues, such as those caused by the papillomavirus 16 oncogene E6 or E7 nucleic acid sequences and including blistering diseases (e.g. epidermolytic hyperkeratinosis, Dowling-Meara disease), proliferative diseases (e.g. psoriasis, epidermal lysis and Bulosa simplex), ichthyosis disease (e.g. chthyosis bullosa Simens and simplex).
